

hp-Adaptive Finite Elements for Wave Propagation Problems

Leszek Demkowicz

Institute for Computational Engineering and Sciences
University of Texas at Austin

I will attempt to combine an overview of our experience with hp finite elements and the automatic hp-adaptivity for wave propagation problems, with a presentation of new research topics focusing on multiphysics coupled problems.

The first part of the talk will focus on fundamentals of hp-discretizations of wave propagation problems: acoustics, elasticity and electromagnetics. We will shortly discuss the issues of stability and approximability for time-harmonic problems emphasizing the difference between the elliptic and Maxwell problems. I will review the main results of the theory of projection-based interpolation and discuss its importance in both the theoretical (proof of discrete compactness for hp methods) and practical (automatic hp-adaptivity) context. This part of the presentation will deliver "punch lines" only, and I will finish it by "flashing" a few representative examples.

The second part of the presentation will address our current work on multiphysics coupled-problems. Using a coupled acoustics/elasticity problem, I will outline new challenges that we have faced when generalizing the hp methodology to this class of problems. This will include a discussion on hp data structures, use of fractional Sobolev norms, and both energy-and goal-driven automatic hp-adaptivity algorithms. The discussion will be illustrated with numerical solutions of numerous problems.
